**Brief Introduction**  
Our comprehensive product lines include all types of fender systems in various sizes types. We can provide single fender elements if required, or complete fender systems to include the rubber fender bodies, steel frontal frames, chains, shackles and associated hardware in one complete package. However we also design and build custom fenders to suit any requirement. If you do not find it in our documents, just ask and we will assist you to determine a fender system to suit your specific needs.

**Purpose**  
Marine fenders are an integral part of most large multi-use docks and piers. A well designed fender system, tailored to specific vessel requirements, will protect a berthing facility and vessels for many years with minimal upkeep and/or future modification. We can supply the full range of cost-effective, safe and tough fender systems from small marina fenders to container ship fender systems designed to withstand the punishment of the largest vessels in the world.
